optim.py

In []: import numpy as np

....

This code was originally written for CS 231n at Stanford University (cs231n.stanford.edu). It has been modified in various areas for use in the

ECE 239AS class at UCLA. This includes the descriptions of what code to

implement as well as some slight potential changes in variable names to be

consistent with class nomenclature. We thank Justin Johnson & Serena Yeung for

permission to use this code. To see the original version, please visi

cs231n.stanford.edu.

.....

This file implements various first-order update rules that are commonly used for

training neural networks. Each update rule accepts current weights and the

gradient of the loss with respect to those weights and produces the ne xt set of

weights. Each update rule has the same interface:

def update(w, dw, config=None):

Inputs:

- w: A numpy array giving the current weights.
- dw: A numpy array of the same shape as w giving the gradient of the

loss with respect to w.

- config: A dictionary containing hyperparameter values such as lear ning rate,
- momentum, etc. If the update rule requires caching values over man

iterations, then config will also hold these cached values.

Returns:

- next w: The next point after the update.
- config: The config dictionary to be passed to the next iteration of the

update rule.

NOTE: For most update rules, the default learning rate will probably \boldsymbol{n} ot perform

well; however the default values of the other hyperparameters should w

```
ork well
for a variety of different problems.
For efficiency, update rules may perform in-place updates, mutating w
setting next w equal to w.
def sgd(w, dw, config=None):
 Performs vanilla stochastic gradient descent.
 config format:
 - learning rate: Scalar learning rate.
 if config is None: config = {}
 config.setdefault('learning rate', 1e-2)
 w -= config['learning rate'] * dw
 return w, config
def sgd momentum(w, dw, config=None):
 Performs stochastic gradient descent with momentum.
 config format:
 - learning rate: Scalar learning rate.
 - momentum: Scalar between 0 and 1 giving the momentum value.
   Setting momentum = 0 reduces to sqd.
 - velocity: A numpy array of the same shape as w and dw used to stor
e a moving
   average of the gradients.
  11 11 11
 if config is None: config = {}
 config.setdefault('learning rate', 1e-2)
 config.setdefault('momentum', 0.9) # set momentum to 0.9 if it wasn'
 v = config.get('velocity', np.zeros like(w)) # gets velocity, else
sets it to zero.
 # ================== #
 # YOUR CODE HERE:
     Implement the momentum update formula. Return the updated weigh
ts
 # as next_w, and store the updated velocity as v.
 v = config['momentum']*v - config['learning_rate']*dw
 next w = w + v
```

```
# ----- #
 # END YOUR CODE HERE
 config['velocity'] = v
 return next w, config
def sgd nesterov momentum(w, dw, config=None):
 Performs stochastic gradient descent with Nesterov momentum.
 config format:
 - learning rate: Scalar learning rate.
 - momentum: Scalar between 0 and 1 giving the momentum value.
   Setting momentum = 0 reduces to sgd.
 - velocity: A numpy array of the same shape as w and dw used to stor
e a moving
  average of the gradients.
 if config is None: config = {}
 config.setdefault('learning rate', 1e-2)
 config.setdefault('momentum', 0.9) # set momentum to 0.9 if it wasn'
